Code repetition, there is code repetition in each case of the switch statement within the editPatientInformation() method.

This makes the code less readable and more error prone.

```java
            Scanner scanner = new Scanner(source: System.in);
            id = scanner.nextInt();
            if(id < 1){
                System.out.println(x: "That id is not a valid number. Try again: ");
            }else if(consultory.getPatients().size() >= 1){
                for(int i = 0; i < consultory.getPatients().size(); i++){
                    if(id == consultory.getPatients().get(index: i).getId()){
                        System.out.println(x: "That id is already taken. Try again: ");
                        idRepeated = 1;
                        break;
                    }
                }
            }
            if(idRepeated == 0){
                System.out.println(x: "Change successfully made.");
                break;
            }
        }catch(Exception e){
            System.out.println(x: "You just wrote string or float data. Try again: ");
        }
    }
    consultory.getPatients().get(index: indexOfPatient).setId(id);
    break;
case 2:
    String name;
    System.out.println(x: "Enter new patient name: ");
    while(true){
        try{
            Scanner scanner = new Scanner(source: System.in);
            name = scanner.nextLine();
            System.out.println(x: "Change successfully made.");
            break;
        }catch(Exception e){
            System.out.println("Error: " + e);
        }
    }
    consultory.getPatients().get(index: indexOfPatient).setName(name);
```
